RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 318 pages. Original publisher: Silver Spring, Md. : U. S. Dept. of Commerce, National Oceanic and Atmospheric Administration, National Ocean Service: Coral Reef Conservation Program, 2010 OCLC Number: (OCOLOC)703421559 Subject: Coral reef conservation -- Palau. Excerpt: . . . where z is the distance from the water surface (positive downwards), and u is the stress velocity at the u surface. The actual eddy viscosity in the water column is a combination of N and N and; the velocity profile is a z combination of the bottom boundary layer and the surface boundary layer. This leads to complications in numerical modeling of the currents and various schemes have been suggested for combining the eddy viscosity terms. It is clear that the velocity shears induced by wind at the surface of the water have a significant role in the vertical mixing of the surface solar heated layer. Mixing due to Wave Breaking Ocean waters are also vertically mixed by breaking waves. In the open ocean, most of the wave energy is conserved and not lost to mixing processes. It is only when the waves become non-linear that they lose energy to turbulence. It is the process of wave breaking that dominates the transfer of wave energy to mixing. At reef fronts the transfer is almost complete with only a remnant of wave energy being reflected back to the ocean, some of it transferring to a forward bore in the breaking wave, and a significant fraction going into turbulence at the breaker location. For a propagating surface gravity wave, most of the energy is in the upper part of the water column. This is illustrated in Figure 3 where we show the depth profile of the horizontal surge velocity for...
