RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 22 pages. Original publisher: Washington, D. C. (810 7th St. , N. W. , MS9800, Washington 20241-0001) : U. S. Dept. of the Interior, Bureau of Mines, 1992 OCLC Number: ocm27869586 Subject: Firedamp -- Pennsylvania -- Cambria County. Excerpt: . . . 55 MMcf of gas drained in the next 5. 5 months ( core-seem to be a valid premise, since there is no reason to hole 13 versus corehole 11 ). As discussed previously, a believe that gas could only be released from overlying MMcf ) was potentially larger volume of methane ( 310 strata confined by an area equal only to the size of the extracted panel itself. The mining of the coal and the drained from the zone of gas emissions over an extended subsequent fracturing of the overlying strata to form the ( table 2 ). 1 time period prior to mining of panel gob certainly extends some distance laterally beyond the 1 As can be seen from the data in table and plotted in perimeter of the panel. It would also follow that a zone of figure 5, there were generally minimal changes in the reduced reservoir pressure would extend laterally beyond volume of gas drained from the rocks as opposed to the the perimeter of the extracted panel, and as discussed coalbeds the presumed zone in volume drained from the previously, the release of gas from coal, which has been of gas emissions. By comparing the rock in-place gas shown in this study to be the primary source of gob gas, is corehole ( 10 ) to values from the least mining influenced initiated by lowering the reservoir pressure. It is also pos-the most influenced corehole ( 11 ), it was determined...
