The sizes of eye-bar heads, and sometimes of the eye-bars, are also dependent upon the size of pin. The various steps of the calculation are interdependent, and must first be made tentatively, and then revised until accordant results are reached. It is generally convenient to assume, first, a size of pin, based on other similar designs, then the thicknesses of bearings and sizes of eye-bar heads can be determined. The packing of members is then arranged, and, finally, the stresses in the pin calculated and the exact size determined. The other calculations are then revised if necessary. Small variations in size in the different pins of the same bridge are undesirable, only two or three sizes generally being used. A pin must be analyzed as a short beam subjected to heavy shearing and bending stresses. The bearing pressures of the members on the pin are also high. A pin must then be designed with reference to (1) shear, (2) bending, and (3) bearing or crushing. (1) Shearing Stresses.--The shearing stresses on a pin are found, as in any beam, by summing up the forces acting on one side of any given section. In dealing with pins it is convenient to resolve all forces into horizontal and vertical components and then to...
